

Zhi Yi Ong is a DECRA research fellow in the School of Psychology, UNSW. Zhi completed her PhD in biomedical science at the University of South Australia and received postdoctoral training at the University of Pennsylvania, USA. Zhi is interested in understanding the neurobiological mechanisms of food intake control and addiction. Using multi-level approaches in rodent models, her research explores the neural circuits, neuropeptide function, gut-brain interaction, and intracellular signaling pathways that contribute to the control of feeding and addictive behaviours.
